

Generalized parton distributions:

Status and perspectives

C. Weiss (Jefferson Lab), SPIN2008, 10–Oct–08

Factorization: Inclusive eN scattering

$$\sigma_{\text{incl}} = \left| \begin{array}{c} e \xrightarrow{Q^2} e' \\ | \\ N \end{array} \right|^2$$

- Factorization of cross section

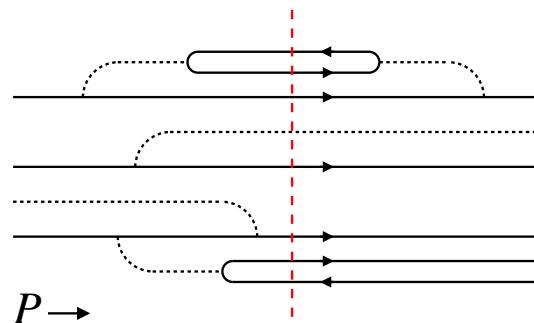

Quark subprocess short distance
 $\sim 1/Q$

Parton distribution long distance
 $\sim R_{\text{hadron}}$

$$= \begin{array}{c} e \xrightarrow{Q^2} e' \\ | \\ x \quad x \\ | \\ \text{PDF} \end{array}$$

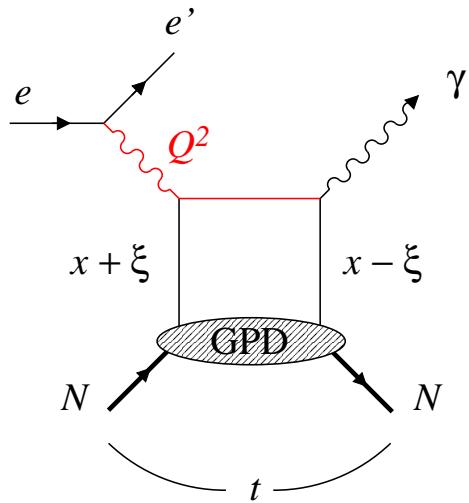

- PDF as matrix element

$\langle N | \bar{\psi}(0) \dots \psi(z) | N \rangle_{z^2=0}$ QCD operator

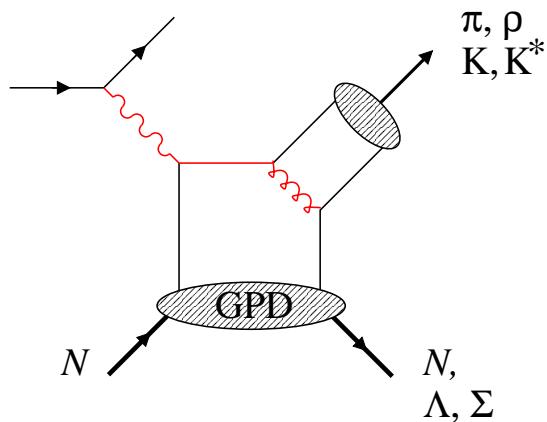

- Space-time interpretation:
Density of quarks with longitudinal momentum xP in fast-moving nucleon
[Feynman, Gribov 70's]

Factorization: Exclusive processes in eN

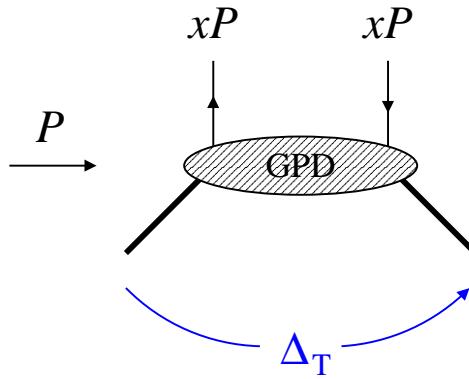

- Photon/meson produced in reaction with single parton in target
- Generalized parton distribution $H(x, \xi; t)$
 - combines aspects of PDF and elastic FF
 - universal, process-independent!

- Factorization = short-distance dominance
Finite-size corrections?

[D. Müller et al. 94; Brodsky et al. 94;
Collins et al. 96; Radyushkin 96, Ji 96]

GPDs: Transverse spatial distribution

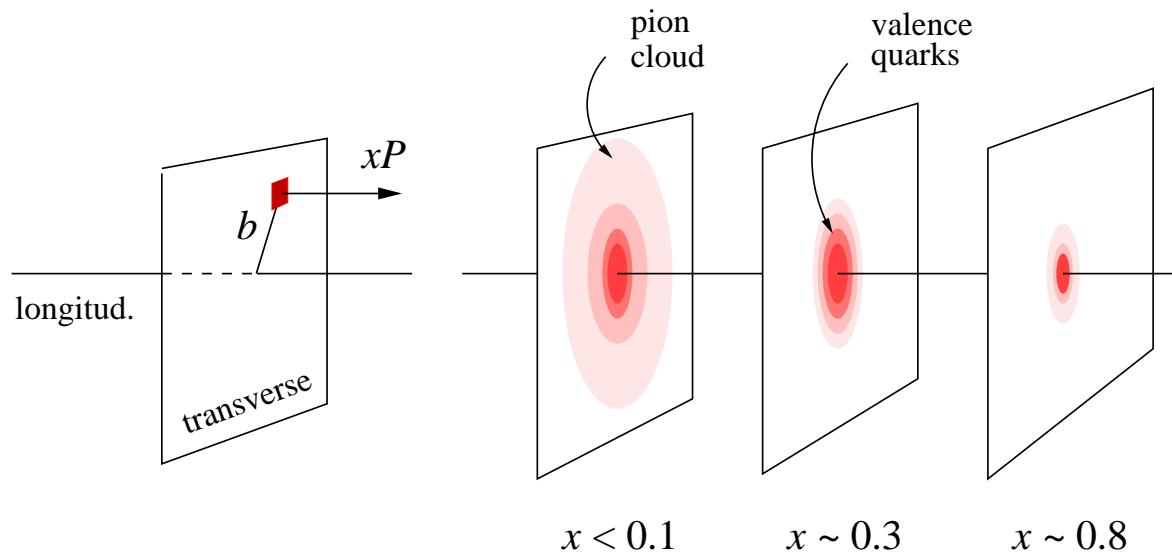

- Transverse coordinate representation ($\xi = 0$)

$$H(x, -\Delta_T^2) = \int d^2 b \ e^{-i\Delta_T \cdot b} f(x, b)$$

FF of partons
with mom. xP

transverse spatial
distribution

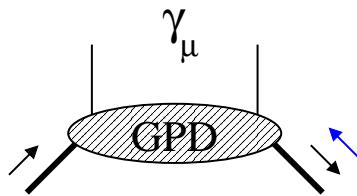

- “Tomographic” image of nucleon at fixed x

- Nucleon structure!
Valence quarks
“pion cloud”
gluons . . .

GPDs: Polarization

Quarks
unpolarized:

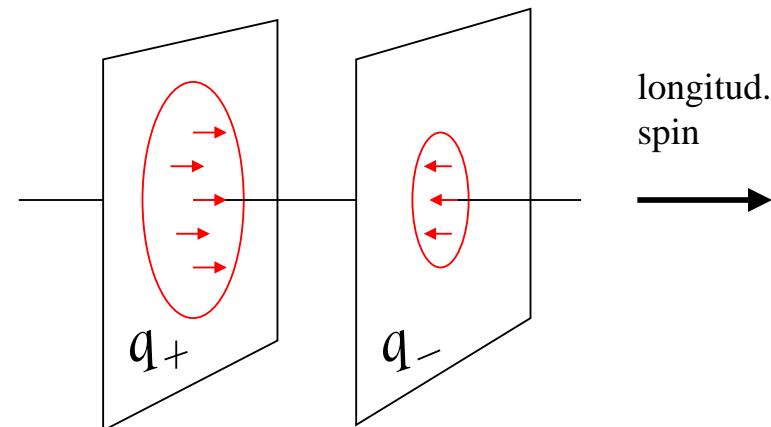

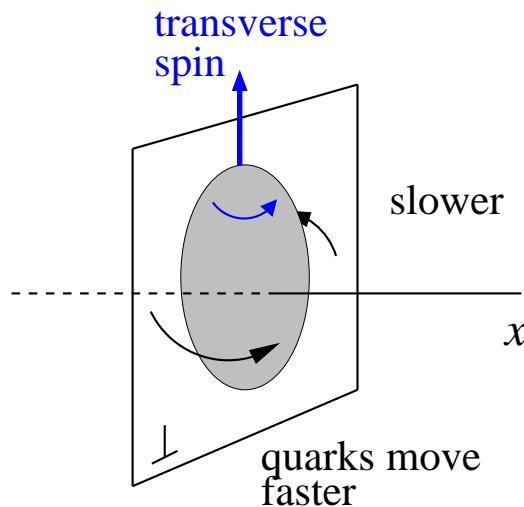

$= H,$
Dirac E
 Pauli

(+ Transversity)

polarized:

$$\gamma_\mu \gamma_5$$

$\tilde{H},$
axial \tilde{E}
 pseudoscalar

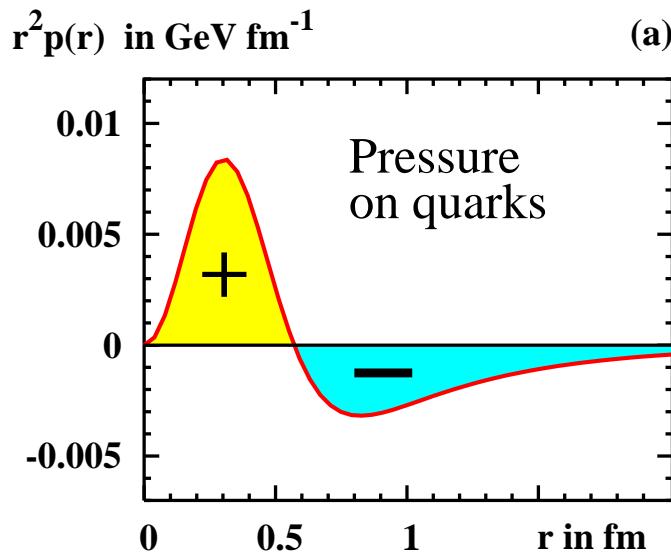

E : Distortion of quark longitudinal motion by transverse spin [Burkardt 03]

$H \pm \tilde{H}$: Spatial distribution of quark helicity

GPDs: Sum rules

$$\int dx x [H^q + E^q](x, \xi; t) = J^q$$

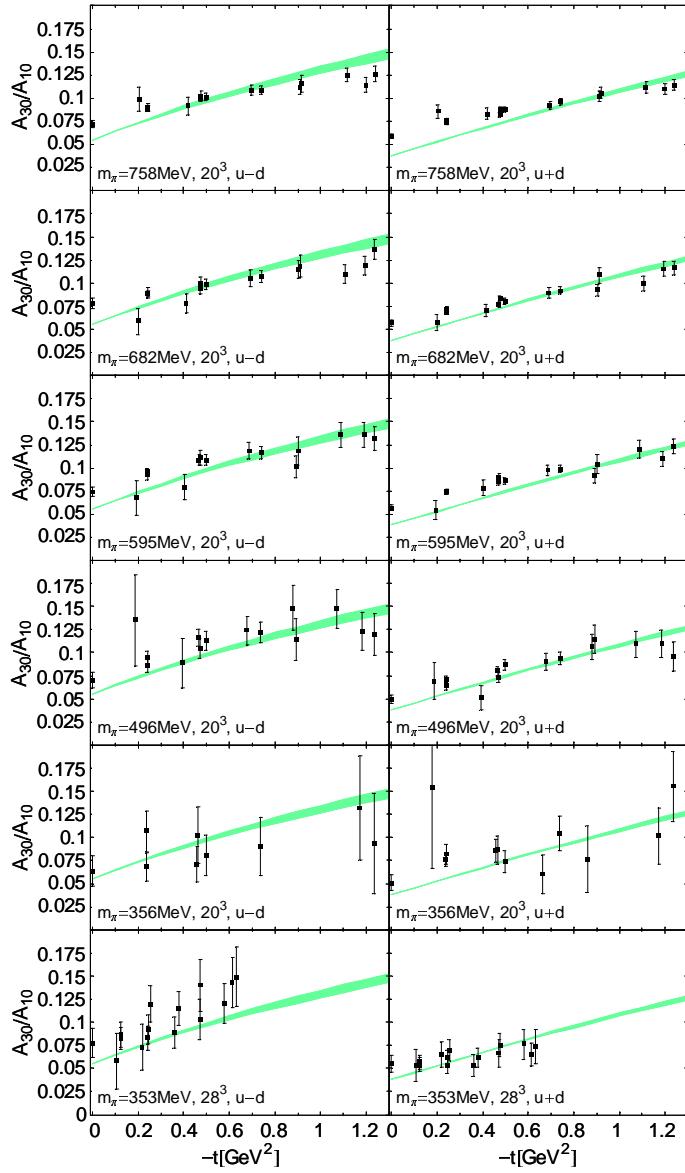

Quark angular momentum [Ji 97]

Stability: Positive \leftrightarrow negative
[Goeke, Schweitzer et al. 07]

- Moments $\int dx x^{n-1} \leftrightarrow$ local operators
 $n = 2$: QCD energy-momentum tensor
- Access to J^q
 - E^q : neutron DVCS, transv. target
 \rightarrow Talk by E. Voutier
 - Model dependence: x integration, extrapolation $t \rightarrow 0$
- Other formfactors of EM tensor:
Distribution of forces on quarks
(pressure, shear forces) [Polyakov 03]

GPDs: Lattice calculations

- GPDs universal }
Twist-2 operator } can be calculated
on lattice
- ↔ TMDs ?
- Lowest moments $n \leq 4$, t -dependence
- Presently non-singlet $q - \bar{q}, u - d$
Singlet: Disconnected diagrams
Hägler et al. [LHPC Collab. 07]
→ Talk by H.-W. Lin
- Potential to constrain GPD
parametrizations in the future
[see e.g. Liuti et al. 06]

GPDs in eN scattering

- Basic information from

$$\left. \begin{array}{ll} \text{parton densities} & q(x) = H(x, \xi = 0, t = 0) \\ \text{elastic form factors} & F(t) = \int dx H(x, \xi, t) \end{array} \right\} \text{GPD models, parametrizations}$$

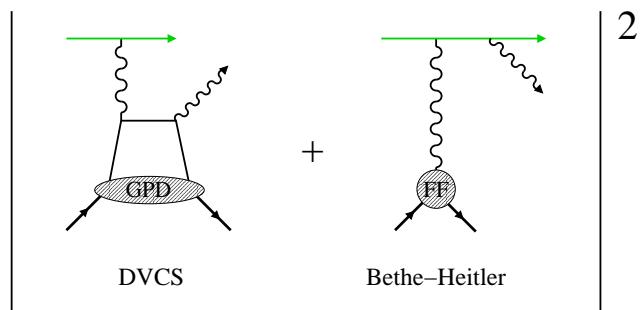

- “New” information about $x, \xi \leftrightarrow t$ correlation from hard exclusive processes

- Test reaction mechanism!

- Short-distance dominance? Corrections? Factorization?

- Extract information about GPDs!

DVCS: Reaction mechanism

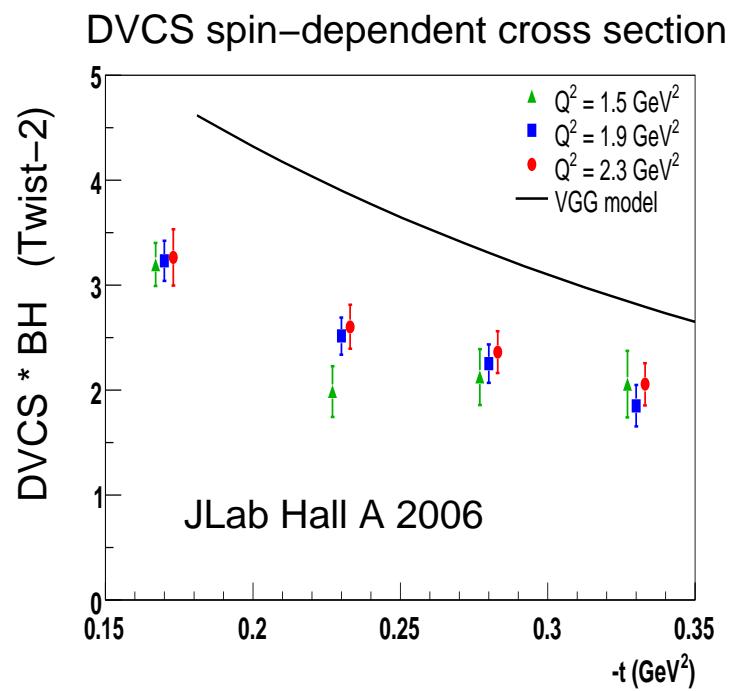

- Interference Bethe–Heitler DVCS allows access at amplitude level

$$\text{Im}(\text{DVCS}) \sim H(x = \xi, \xi; t)$$

$$\text{Re}(\text{DVCS}) \sim \int dx \frac{H(x, \xi; t)}{x - \xi}$$

$$\xi \leftrightarrow x_B$$

- Recent cross section measurements indicate early approach to scaling

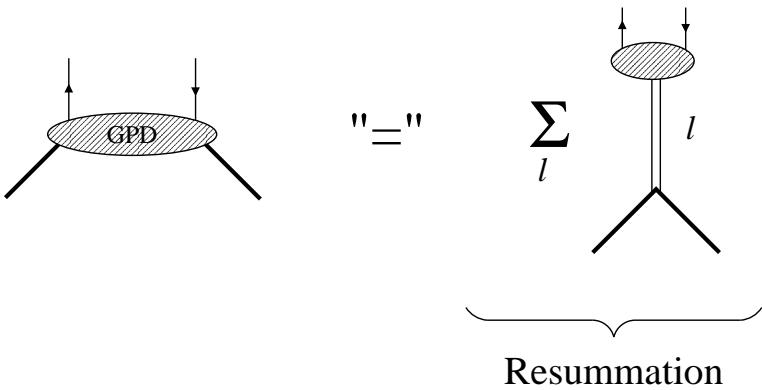

“Test” of factorization

- Need to separate H, E
→ Talk by E. Voutier

DVCS: New analysis tools

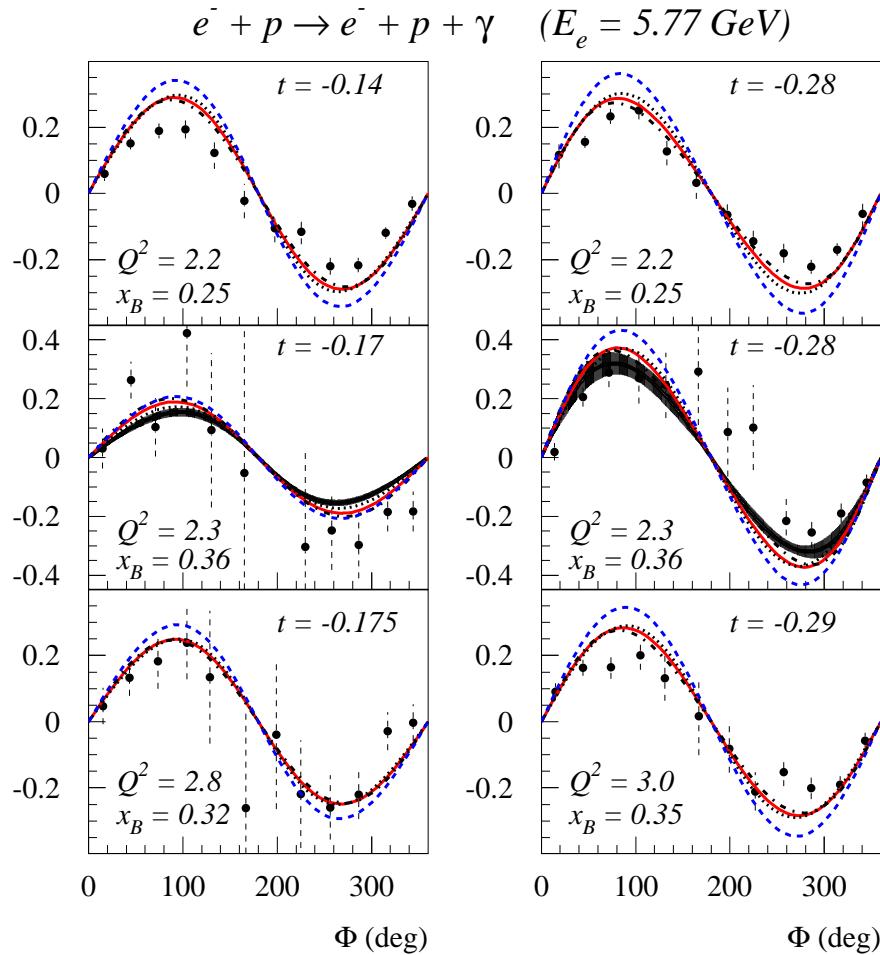

$$\text{Re}A = \underbrace{\int_{\text{Disp}} \text{Im}A}_{H(\xi, \xi; t)} + D(t)$$

- Dispersion relation for hard exclusive amplitude
 - Model-independent
 - Accessible information $H(\xi, \xi; t)$
+ “D-term” [Polyakov, CW 99]
- [Teryaev 05; Anikin, T. 07;
Müller et al. 07; Diehl, Ivanov 07]

- Parametrizations based on t -channel exchanges (cf. dual amplitudes)
 - Regge-like behavior at small x
 - QCD evolution “automatic”
- [Polyakov, Shuvaev 02;
Kumericki et al. 06: NLO]

DVCS: New analysis tools II

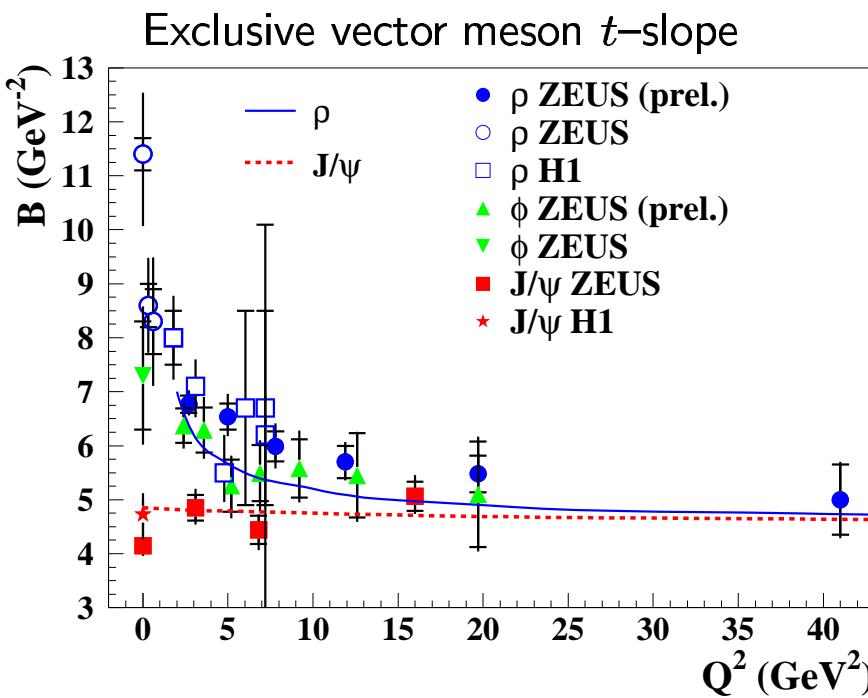

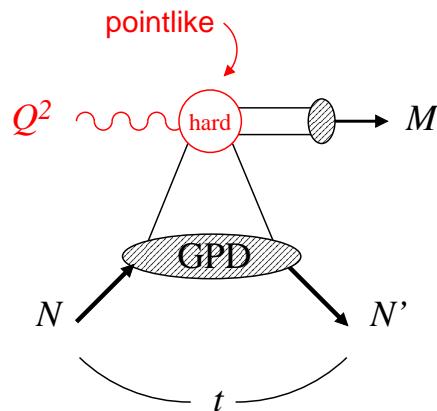

JLab CLAS DVCS beam spin asymmetry

- Combined analysis of JLab DVCS data
 - $\text{Im } A$ from absolute cross section data (Hall A)
 - $\text{Re } A$ from “minimal model” + dispersion relation
 - Reproduces well beam spin asymmetry data (CLAS, Hall A)

[Vanderhaeghen, Polyakov 08]

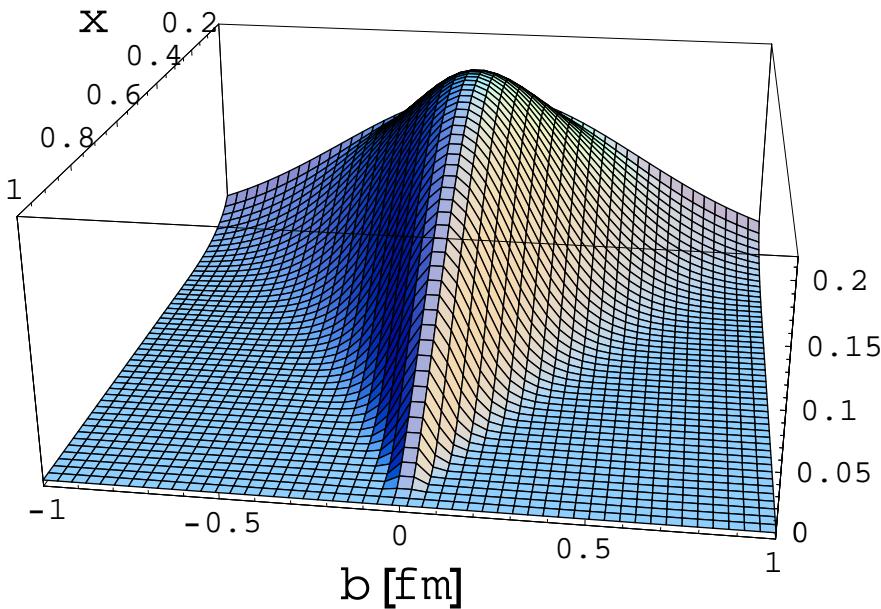

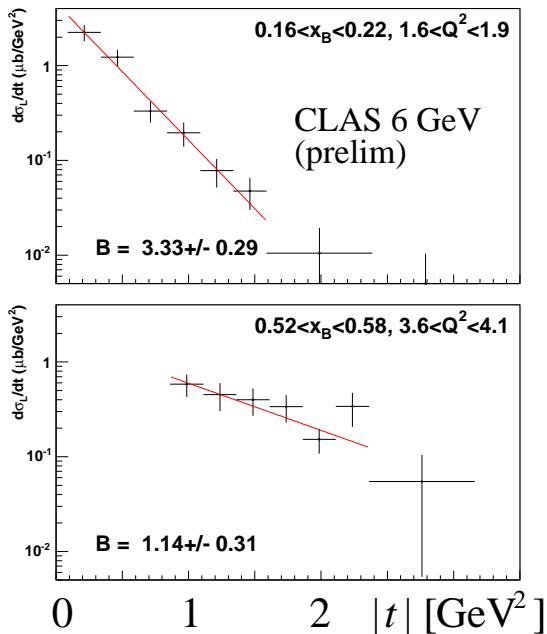

Meson production: Reaction mechanism

- J^{PC} + flavor select GPD
- $Q^2 \rightarrow \infty$: Meson produced in pointlike configuration
 - t -slope independent of Q^2
 - Seen in HERA vector meson data!
- $Q^2 \sim \text{few GeV}^2$: Substantial finite-size corrections (higher twist)
 - Dynamical models w. intrinsic k_T [Frankfurt et al. 96; Vanderhaeghen et al. 98; Kroll, Goloskokov 05]

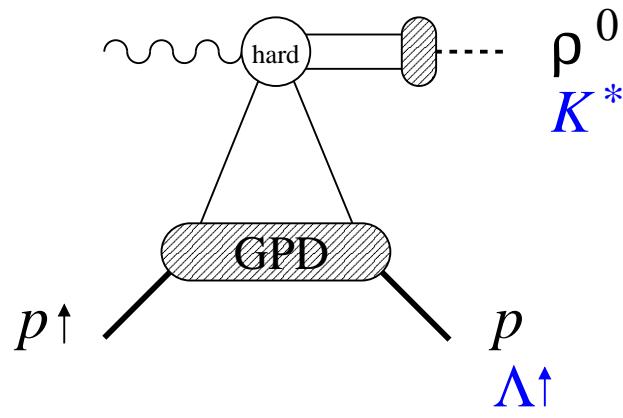

Meson production: Reaction mechanism II

ρ^0 cross section $d\sigma_L/dt$

- CLAS ρ^0 t -slope agrees with present GPD models [Guidal et al. 05]
- Absolute cross sections: Need more theoretical work. . .

Meson production: Cross section ratios

$$\frac{\sigma \uparrow - \sigma \downarrow}{\sigma \uparrow + \sigma \downarrow} \propto \frac{\text{Im}(\mathcal{H}\mathcal{E}^*)}{|\mathcal{H}|^2 + \text{corr.}}$$

Model-dependent analysis!

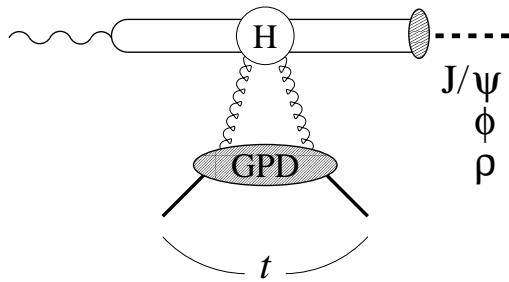

- Transverse target spin asymmetry in $\gamma_L^* p \rightarrow \rho^0 p$ sensitive to helicity-flip GPD E
- Alt: Transverse recoil polarization in $\gamma_L^* p \rightarrow K^* \Lambda$
 $SU(3)$ symmetry: $\langle \Lambda | \dots | p \rangle \rightarrow \langle p | \dots | p \rangle$

- Pseudoscalars π, K probe polarized GPDs

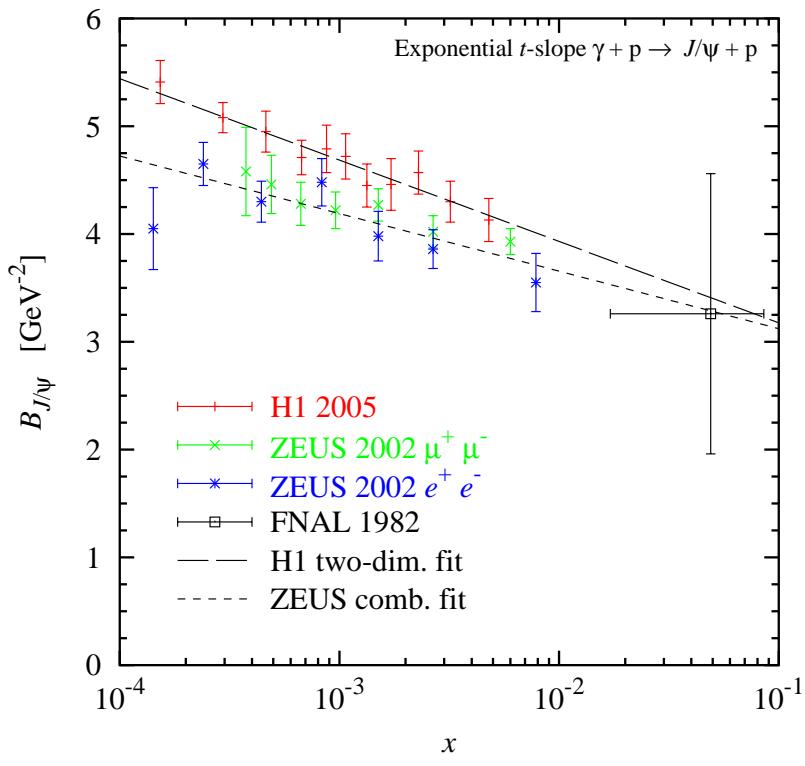

\tilde{H} : Flavor structure $\Delta q, \Delta \bar{q}$

\tilde{E} : “Pole term” in π^+, K^+

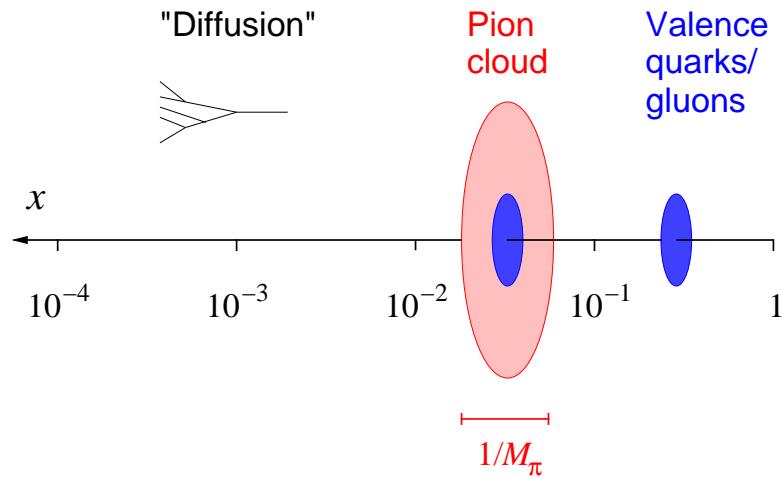

GPDs at small x : Gluon imaging

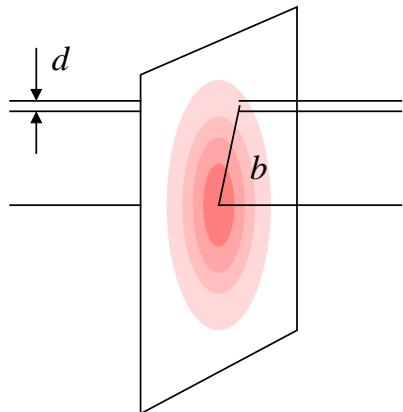

- HERA measurements of t -slope in exclusive $\gamma p \rightarrow J/\psi + p$
 - t -dependence of gluon GPD
 - transverse distribution of gluons

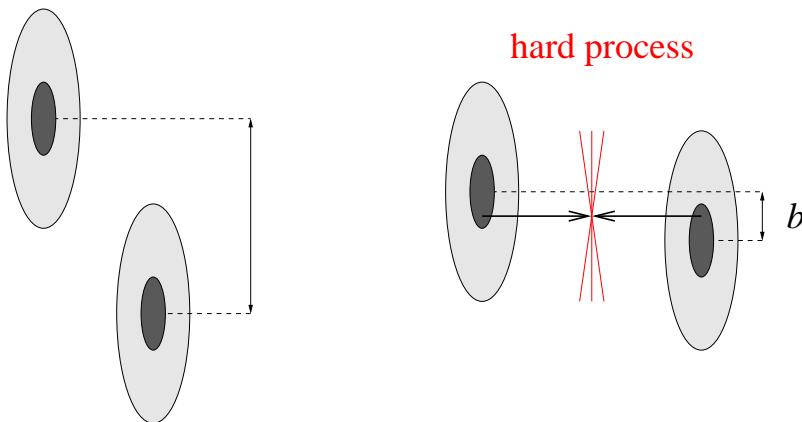

- Precise “gluon imaging” with EIC
[→ Talk by R. Milner]

GPDs at small x : Gluon imaging II

- Transverse gluon distribution
essential ingredient in studies of
unitarity limit/saturation
at small x
 - QCD dipole model

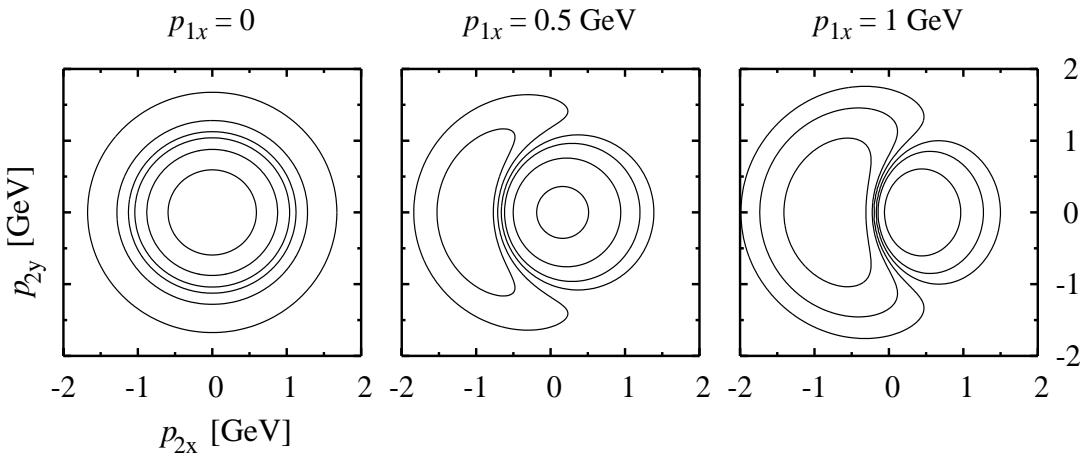

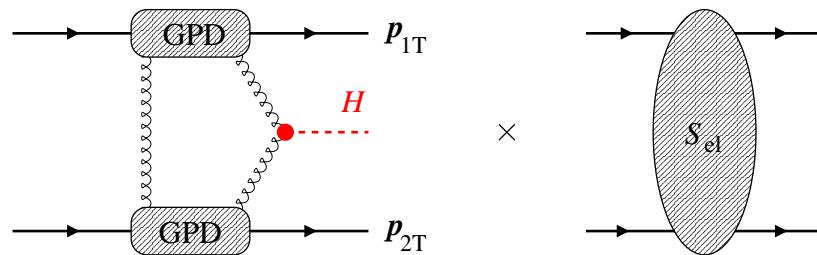

- $p-p$ collisions with hard processes
 - centrality dependence
 - spectator interactions,
underlying event structure

[Frankfurt, Strikman, CW 04/05]

GPDs in pp : Exclusive diffraction

$$pp \rightarrow p + \text{gap} + H + \text{gap} + p$$

(= dijet, Higgs, $Q\bar{Q}$, ...)

- Diffraction pattern in p_{1T}, p_{2T} sensitive to gluon GPD
- Could be observed in pp with forward detectors

CMS/TOTEM at LHC
STAR pp2pp @ $\sqrt{s} = 500 \text{ GeV}$?

[Frankfurt, Hyde, Strikman, CW 07]

Probe gluon GPD in pp
... New direction!

Summary

- GPDs unifying framework for discussing single-particle quark/gluon structure of hadrons in QCD
“Quark/gluon imaging”
- DVCS: Leading-twist analysis well developed;
work on kinematic and higher-twist corrections
- Meson production: Many interesting possibilities!
Need quantitative theory of finite-size effects
to fully utilize data at $Q^2 \sim$ few GeV 2
- Interesting new connections $ep \leftrightarrow pp$!
